Prenatal DHA reduces low birth weight

KU researchers have found that the infants of mothers who were given 600 milligrams of the omega-3 fatty acid DHA during pregnancy weighed more at birth and were less likely to be very low birth weight and born before 34 weeks gestation than infants of mothers who were given a placebo. This result greatly strengthens the case for using the dietary supplement during pregnancy.

Update your calendar listings

Last week's campus closures, as well as this week's weather threats, have caused many events to be delayed or canceled. Please ensure your departmental calendar administrators have updated events so changes are reflected on calendar.ku.edu.
