Acknowledgments

The writer wishes to express his sincere thanks and appreciation to Dean Raymond A. Schwegler and Dr. J. W. Twente of the University of Kansas for their many helpful suggestions, and to the following superintendents of Sumner county for their interest in the subject and assistance in collecting the data for this study: Superintendent A. D. Zook, Wellington; Superintendent J. H. Pendleton, Caldwell; Superintendent J. A. Steele, South Haven; Superintendent R. E. Snow, Belle Plaine; Superintendent Jesse C. Smith, Mulvane; Superintendent John W. Wengler, Oxford; Superintendent C. L. Kimel, Conway Springs; Superintendent H. H. Baker, Milton; Superintendent G. G. Maxfield, Milan.

Chapter I

A comparative study of the pupils from the rural grade schools and from the urban grade schools in the freshman year of the high schools of Sumner county, Kansas, made by comparing the data obtained from the three following sources:

- (a) Stanford Achievement Test, (b) National Intelligence Tests,
- (c) A limited physical test.

There is an increasing desire on the part of high school principals and teachers to know more about the product that the grade schools are turning into the high schools, both from a mental and from an achievement point of view. There also seems to be a notion among high school principals and teachers that the pupils coming from the rural grades are not as well prepared to do high school work as are those pupils coming from the urban grades.

Not only has the high school faculty a right to know the abilities of these two groups, but it must have this information, if it is to deal with these new groups of pupils in an intelligent manner. Again, the increasing numbers that are coming into the high schools from both the rural schools and urban schools, make it highly important that the high school principals and teachers measure their pupils with the best instruments that the educational field has provided in order to know what

to expect from these pupils and in what way the high school can be of most benefit to them. Moreover, several of the high school principals of Summer county have been planning to make a study of this nature, each in his own high school. Both the high school principals and superintendents have shown their interest in this study by cooperating in every way possible.

Chapter II

A number of studies have been made in different parts of the United States which have had as their purpose, a comparison of rural and urban pupils. The studies have approached the subject from many different angles, and the results have varied widely in different sections of the nation. After studying the results from these different investigations, it would be presumptuous for anyone to say what the results would be for any locality without actually making the test.

1. Norman Frost made a comparative study of country and town schools, by comparing the achievement in each group on the basis of age. He used the ages 10, 11, 12, 13. His conclusions are, that for these four years studied, the rural schools of Madison county, Kentucky, are consistently lower than the schools of Louisville, Kentucky; Patterson, New Jersey; and St. Paul, Minnesota. Tests were given in Language, arithmetic, and reading.

2. The results which Mr. Frost obtained compare quite favorably with the results of a study made by E. A. Taylor with the Courtis

2. (2) Journal of Educational Psychology, Vol. V:461-66.

* Numbers in parenthesis refer to the number of the reference as it will be found in the Bibliography.

Arithmetic, the same test that Mr. Frost used, in the rural schools of a county in Illinois. He compared his results with the scores of 7,008 children, mostly from cities, published by Dr. ^ICourtis in The Elementary School Teacher. A comparison shows that the rural schools are consistently below the city schools. The pupils of the rural eighth grade were two grades below the city eighth grade.

2. The Ohio Survey Commission reports that the median score on 97, 8th grade composition papers from Delaware City, as measured by the Hillegas Scale, was 5.21. As contrasted with this they found that the median score for 118, 8th grade compositions from the country was 3.78. This same report shows results from the Ayers Scale in Handwriting for 1,379 pupils in 176 rural schools in 21 counties in Ohio; 214 pupils in the upper grades in the rural schools of Delaware county; and from 312 pupils in the three upper grades in the city schools of Delaware, also a small city in Iowa based on a report of I. King and H. Johnson (Journal of Educational Psychology, III:514-520). In the small Iowa city, 98 per cent of the 8th grade papers scored over 50 on the Ayers Scale; 77.8 per cent of like papers from Ohio rural schools; 73.5 per cent from Delaware rural schools and 91.3 per cent from the Delaware City schools made scores of over 50. This report shows greater uniformity among the city schools

1. (3) S. A. Courtis, Elementary School Journal, (XII:133 ff)
2. (4) Ohio Survey Commission Report, 1914, Page 133 ff.

than between the rural and city schools.

1. In a study made in Travis county, Texas, where the Courtis Standard Research Test in Arithmetic, Series B, and the Starch Arithmetic Scale A, were used, the eighth grade stood 8 per cent lower than the corresponding grades of Boston and Detroit.

2. In an unpublished survey of the Haldane school, a table on page 30 gives a comparison of median achievements in English composition by grades for Hillegas Scale, Nassau County Extension, with grade medians for the schools of Mobile county, Alabama, and for the city of Mobile. In every grade reported the median for the city schools is higher than for the country schools.

The Virginia Public School Commission gives comparative results from the country and city schools for the following tests: Thorndike Reading Scale A 2; Virginia Reading Test Sigma 8; Virginia General Examination Test I; Ayers Spelling Scale; Starch Scale for Measuring Handwriting; Woody Arithmetic Scale; Series B;

1. Nassau County Supplement to the Hilegas Scale for the Measuring of English Composition. 5,000 of the 16,000 children tested were in the rural schools, grades 3 to 7.

Results: One-room rural schools averaged one year older than the children in the four-room rural schools and one and one-half years older than the children in city schools.

2. Richard Zeidler, using the Curtis Standard Tests, made a study of the rural and village schools of Santa Clara County, California. The results of his tests were as follows: The one-room schools did better than the two-room schools; the three-room rural schools did better than either the one- or two-room schools; or the village schools with four or more teachers. The village schools fall below all three types of rural schools. Each type of school in the county falls below the median for twenty small city schools of the Middle West.

3. Charles Harlin scored the handwriting of 359 pupils in 21 rural schools in Pennsylvania, by the Ayers Scale on Handwriting. He found no material difference when compared with Freeman's average for 56 cities. When these pupils were given the Ayers Spelling Test, the country pupils were uniformly lower than the city

averages, and when results from the Ayers Arithmetic Test are compared with the Curtis Standard, the pupils in the rural grades rank approximately two grades below the pupils of the city schools.

1. M. E. Haggerty reports the results of an Arithmetic test covering five counties in Indiana, as follows: "These data point to the conclusion that the district schools are more efficient in procuring achievement in the function measured than the graded (city) schools.

2. E. H. Taylor, using the Curtis Arithmetic Test, found that the rural pupils ranked about two school grades below the pupils of the same grades of the city schools.

3. A comparison of the standings in all subjects of the eighth grade pupils in the rural schools with those of pupils of the same grade in the city schools in the New Jersey State Final Examination for graduation, shows that the rural pupils rank lower in all subjects than do city pupils.

3. (12) Educational Bulletin, Vol. I, No. 3, 1914, Trenton, N. J.

1. E. J. Ashbaugh found that Iowa rural children compare favorably with Iowa city children in handwriting, both as to speed and quality.

2. W. W. Theisen reports the results for a study made of 36,564 children in Wisconsin, of whom 15,835 were in rural schools. He summarizes as follows: "Judged by the Ayers Standards, rural children in Wisconsin do not spell well. They average not less than ten points below the standard in every grade." This is not conspicuously poorer or better than the pupils in the cities and villages of Wisconsin. The results from 141 rural schools in 28 counties on the Thorndike Handwriting Scale, show that the rural schools, on the whole, make the best showing of Wisconsin schools in handwriting.

3. In a report made from giving the Curtis Standard Reading Test No. 2, to 6,056 rural pupils in 547 schools in 82 counties of Missouri, it was found that the children in all of the grades were below the standard set by Curtis. The Kansas City Scale for Measuring Handwriting shows the seventh and eighth in the school below the accepted standard. According to the Curtis Standard Research Test in

Arithmetic, Series B, the sixth, seventh, and eighth grades are not up to standard. These schools are also below according to the Ayers Spelling Scale.

1. John M. Foote concludes, after giving the Ayers Scales in Spelling and Handwriting in the country schools of Louisiana, that the pupils in the large cities are slightly superior, but show no great difference.

2. Cyrus D. Mead concludes that the rural children of Plumas county, California are just about of the average ability of city children over the same county when judged by the Ayers Spelling List.

3. John E. Worthington concluded, after making a study of writing, spelling, arithmetic, reasoning, geography, and reading in the rural and town schools of Lake county, Indiana, that the results of the tests given indicate that the work of the rural schools is more efficient than that of the town schools.

3. (18) John E. Worthington, "A Comparative Study of the Attainments of Eighth Grade Pupils in the Rural and in the Town Schools of Lake County, Indiana, University of Chicago, 1918. (Thesis.)

1. In the report of the New York Survey we find this conclusion as to rural schools: the results tend to show, "that the small rural schools do work inferior to the large (four-room) rural schools and that the latter seldom reach the standard norm. The small schools lag behind about a full year."

2. In the survey of the Gentry County public schools, Bert W. Loomis reports that the rural schools were below the town schools in all subjects tested. The rural schools average almost one year below the Standard.

3. Fred D. Cram concludes from the survey of rural schools in Iowa, that rural children are mentally as bright as town children, but in achievement they are consistently below the town children.

After reading the reports of those who have compared rural and town pupils in different parts of the United States, one is convinced that the only way to determine what the results will be in any particular locality is to make the study and find out.

Chapter III

The purpose of this thesis is to make a comparative study of the pupils who have completed the eighth grade in the rural schools and the pupils who have completed the eighth grade in the town schools, at the time they enter the high schools -- ninth grade -- of Sumner county, Kansas. This is to be done by comparing the data received from the two Standard Tests mentioned below and a limited physical study.

In order to answer this thesis, it will be necessary to answer these two questions:

(a) In what respects, as shown by these data, are the two groups alike?

(b) In what respects, as shown by these data, do the two groups differ and to what extent do they differ?

The National Intelligence Tests, Scale B, Form 1, was used in testing mental ability and the Stanford Achievement Test, Advanced Examination, Form A, was used as a test of Achievement. For the physical data, a record was made of the following points: height, weight, vision, hearing, teeth, and throat. These data were obtained from the records made by the school nurses who examined the children during the first semester, fall of 1925. Copies of the Standard Tests used and the form on which the physical data were recorded are found in the Appendix.

In this study, the expression "high school" will refer to those high schools which include the twelfth grade in their organization. There are four towns in the county that have the ninth and tenth grades only in their high school. These schools are not included in this study. The expressions "rural schools" and "rural grades" will be used to refer to those grade schools in the county with less than three teachers in the grade organization -- the first eight grades. The expressions "urban schools" and "urban grades" will be used to designate those schools in the county having three or more teachers in their grade organization. In Sumner county, it happens that no school outside of an incorporated town has three or more teachers in its grade organization. Pupils who did their eighth grade work in an urban school are classed with the urban group. Pupils who did their eighth grade work in a rural school are classed with the rural group.

Chapter IV

During the summer of 1925 the author obtained the consent of each high school principal and of each city superintendent, in the towns where the tests were to be given, to get the data used for this study. Most of them were anxious for the study to be made, offering to assist in every way possible. The two Standard Tests were in the hands of the writer by September 15. The actual work of testing was not started, however, until September 21, two weeks having been allowed for all of the high schools of the county to complete their enrollment. The Stanford Achievement Test was given the week of September 21 to 25. The National Intelligence Tests were given the week of September 28 to October 2.

The Tests were given in each high school under the supervision of the high school principal or superintendent of city schools. The writer met with the one in each school who was to give the Tests there and explained all of the details of giving the Tests. Also, a manual of directions was left with each administrator who was to supervise the giving of the Tests. The writer was fortunate in having in each town, men in charge of the Tests, who were both interested in the study and had had more or less experience in handling Standard Tests.

In four high schools the scoring was done in the school where the Tests were given and under the direction of the one giving the Tests. In order to check against errors, all papers were rescored by the writer. The Tests from the other six schools were scored by the writer.

The Tests were given to the freshman class in each of the ten high schools of Sumner County, Kansas. These high schools are located in the following towns: Wellington, Caldwell, South Haven, Mulvane, Conway Springs, Belle Plaine, Argonia, Oxford, Milton and Milan. The total enrollments in these high schools range from 500 to 50 in the order named above.

How This Study Differs From Other Studies

This study differs from other studies of the same subject in that the Tests were given to both groups, in each school, under the same condition, at the same time, and by the same person. Most of the studies on this subject have been made from data obtained from Tests given to the two groups under different conditions. While it would seem that the method used for giving the Tests used in this thesis ought to be the basis of a more accurate comparison, there is no proof that such is the case.

Representativeness of the Two Groups

In May, 1925, there were 235 who finished the eighth grade in the rural schools of Sumner county. In September, 1925, 205 took one or both Tests given by the author, as shown by Table I, column 3. This is 87.2 per cent of the number who completed the eighth grade in May. The number completing the rural schools in the county was obtained from the records in the office of the county superintendent of Sumner county. From these same county records and from the records in the offices of the city superintendents, we found that there were 313 who finished the eighth grade in the urban schools of Sumner county, in May, 1925. In September, 1925, 274 took one or both Tests, as shown by Table I, column 4. This is 87.5 per cent of the number who completed the eighth grade in May, 1925. From this it would seem that we are justified in making the statement that the freshmen from the rural schools come as nearly representing the

entire number who completed the eighth grade as do the freshmen from the urban schools. If this be true, we do not have a more selective group with the one than with the other. It would also seem that the results obtained from comparing the two groups should be relatively the same as they would have been, had the study been made with these pupils while they were in the eighth grade.

Number Taking One or Both Tests

In these ten high schools there were 496 who took one or both tests. There were 17 who took the Achievement Test but did not take the Intelligence Tests. There were 25 who took the Intelligence Tests but did not take the Achievement Test. The failure to take both Tests was due to absence from school.

Table 1, page 24, shows the name of each town and the number from each group taking the Stanford Achievement Test and the number from each group taking the National Intelligence Tests. Twenty-one of Wellington's pupils and four of Caldwell's pupils who took the National Intelligence Tests did not take the Stanford Achievement Test. Wellington had two, Caldwell three, South Haven three, Mulvane three, Belle Plaine three, Oxford two, Conway Springs one, who took the Stanford Achievement Test but did not take the National Intelligence Tests. From this we see that those who did not take both Tests

came mainly from the larger schools of the county.

Table 2, page 25, gives the name of each town and the number of each group taking both Tests. There were 256 from the urban group and 198 from the rural group. Stated in terms of per cent of the total number who took both Tests, 57 per cent were urban pupils and 43 per cent were rural pupils. This is practically the same per cent as the number from each group taking one or both Tests who can be classified as urban and rural -- see Table I, columns 3 and 4. The per cent is, urban -- 57.2, rural -- 42.8.

Method of Pairing

It seems to the author that the best method of comparing the two groups as to achievement is to eliminate, as nearly as possible, the factors of intelligence and age. This was done by pairing the two groups on the basis of intelligence and age. In no case did the intelligence scores for each pair differ by more than four points on the National Intelligence Test score. In but few cases did the ages differ by more than four months.

This process of pairing produced 161 pairs which we were able to compare as to achievement, intelligence and age being as nearly equal as possible. The average difference in age was .26 of a month. The results of pairing are shown in Table 3, page 26.

It will be noted that Q_3 and Q_1 vary by .2 and .3 of one unit respectively, but the medians are the same.

Using these 161 pairs, comparison in achievement is made for each of the nine tests, the total scores in Reading and Arithmetic, and also, the composite score for the entire Test. This makes a total of twelve sets of scores shown in tables which are numbered 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15. Pages 29 to 40, inclusive.

Tables of Comparison Explained

Tables numbered 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 show the results of these comparisons. A detailed explanation of Table 4 will make the interpretation of these twelve tables clear. In this table which shows the results of the Paragraph Meaning scores, the mean for the urban group is 78.88 while that of the rural group is 75.08 "diff of av." shows the difference between these two means. σ^1 is used to refer to the standard deviation of the distribution, e. g. σ for the urban group is 3.02 and σ for the rural group is 2.97. σ_{av} -- read standard error for the average -- is obtained from the formula $\sigma_{av} = \sqrt{\frac{\sigma_{dis}^2}{N}}$

.....

1. (22) "Statistics in Psychology and Education" Henry E. Garrett, Page 121.
2. (23) See (22) above, Page 121.

Its function is to show the limits within which the true average of the distribution would lie. For example, in the urban group the chances are 997 in 1000 that the true average will lie within the limits $78.88 \pm 3\sigma$ or $78.88 \pm 3 \times .237$, or between 79.591 and 78.169. The limits of the true average for each group are not shown since it is the amount of difference between the two means in each test and the reliability of this difference that we are concerned with in this study. Another reason for not showing the limits of the true average for each distribution is that, under the explanation of the reliability of the difference (σ_{diff}) it will be seen how much above zero the true difference would lie.

As stated above, "diff of av." shows the amount by which the means or averages of the two groups differ. In the case of the means in Table 4, the difference of the average is 3.80. How reliable is this difference? Or, stated another way, what are the chances that there will always be a difference in favor of the urban group, if the tests were repeated? These questions can be answered by finding the reliability of the difference, written σ_{diff} . It is obtained from the formula $\sigma_{diff} = \sqrt{\sigma_{av_1}^2 + \sigma_{av_2}^2}$. σ_{av_1} means σ_{av}

.....

1. (24) See (22) above, Page 129 ff.
2. (25) See (22) above, Page 123 ff.

of the urban group and σ_{av_2} means σ_{av} of the rural group. In Table 4, $\bar{\sigma}_{diff} = .333$. The chances are 997 in 1000 that the true differences between the averages of the two groups lies within the limits, $diff. of av. \pm 3 \sigma_{diff}$. In Table 4 it is $3.80 \pm 3 \times .333$, or between 4.799 and 2.801. Again, we can be almost certain that the difference between the means of the two groups will never be less than 2.801 which is the lowest limit of the true difference. Graph 5, Page 45, illustrates the above points. The red bar shows the number of units between zero difference and the lowest limits of the true difference for each of the twelve comparisons. In no case does this lowest limit reach zero. Its distance above zero varies from .438 in the Arithmetic Reasoning Test, to 19.9 in the Total Score, column 12. Stated in sigma terms, the range is from 1.7σ to 52.4σ . The top of the blue bar and the top of the red bar mark the upper and lower limits respectively, of the true difference for each set of the means for each of the twelve sets of scores in the Achievement Test. The distance between these two limits indicates the number of units. In each case this distance represents $6 \sigma_{diff}$.

If we will now divide the mean difference by the $\bar{\sigma}_{diff}$, we shall find how far the zero difference lies below the mean in $\bar{\sigma}$ terms. Referring again to Table 4 and column 1, in graph 6, $\frac{3.80}{.333} = 11.4 \bar{\sigma}$.

.....

1. (26) see (22) above, page 130.
2. (27) see (22) above, page 133.

Since 3σ indicates complete reliability. Graph 6 shows how far the zero difference lies below the mean difference in σ terms for each of the twelve sets of scores. This graph shows that the difference varied from 4.7 σ in the Arithmetic Reasoning Test, to 55.4 σ in the Total Score, column 12. Again, this graph expresses in σ terms, the distance from the top of the red bar in Graph 5, to the zero line plus three sigma.

E. A. Indicates the difference in the means of the two groups in terms of Educational Age as shown by norms set up for the Stanford Achievement Test. In Table 4, it will be noted that this difference is ten months in favor of the urban group. The results in all of the Tests, excepting the tests in Arithmetic, shown in Tables 8, 9, 10, are in favor of the urban group. In Tables 8, 9, 10, the results show that the rural children do better work in Arithmetic, both as to Computation and Reasoning, than do the urban children. Graph 4, brings out this fact more clearly. This graph shows the number of months of Educational Age that the two groups differ for each of the twelve sets of scores. The letter at the top of the bar indicates whether the difference is in favor of the urban or the rural group. This difference ranges from one month in the Arithmetic Reasoning Test, column 6, to eleven months in the Reading Total score, column 4.

The scores of the several tests have been weighted by the authors of the Test so that they will give a composite score

as shown in Table 15, and column 12 in Graphs 1, 2, 3, 4, 5, 6. The weighting has been done in this manner: the number of correct answers in the Paragraph Meaning test is multiplied by two; the number of problems correct in Arithmetic Computation and the number of correct answers in Arithmetic Reasoning are multiplied by four; in both Nature Study and Science and History and Literature the number of correct answers, divided by two, is subtracted from the number of correct answers; in Spelling-Dictation Exercise -- the number correct is multiplied by two.

	N = 161	N = 161	$\frac{5.10}{.301} = 16.9 \sigma$
			E. A. is 6 months in favor of Urban

TABLE 13. FREQUENCY DISTRIBUTION OF SCORES MADE BY EACH GROUP ON THE STANFORD ACHIEVEMENT TEST IN LANGUAGE USAGE

Language Usage Score	Urban	Rural	
55-58	1		
51-54	4	3	
47-50	8	4	Urban Group
43-46	18	11	Mean = 33.37
39-42	16	18	$\sigma = 2.52$
35-38	22	18	$\sigma_{av} = .198$
31-34	29	19	<hr/> Rural Group
27-30	24	29	Mean = 30.16
23-26	15	19	$\sigma = 2.59$
19-22	10	15	$\sigma_{av} = .204$
15-18	8	14	<hr/>
11-14	4	6	diff. of av. = 3.21
7-10		2	$\sigma_{diff} = .284$
3-6	1	3	true difference between
0-2	1		4.062 & 2.358
	N = 161	N = 161	$\frac{3.21}{.284} = 11.3 \sigma$

E. A. is 9 months in favor of Urban

TABLE 14. FREQUENCY DISTRIBUTION OF SCORES MADE BY EACH GROUP ON THE STANFORD ACHIEVEMENT TEST IN SPELLING: DICTATION EXERCISE

Spelling Score	Urban	Rural	
202-209	6	5	
194-201	9	1	Urban Group
186-193	11	6	Mean = 155.72
178-185	9	14	$\sigma = 3.47$
170-177	18	12	$\sigma_{av} = .273$
162-169	18	27	
154-161	19	18	Rural Group
146-153	13	15	Mean = 153.44
138-145	14	16	$\sigma = 2.97$
130-137	12	18	$\sigma_{av} = .234$
122-129	7	11	
114-121	9	11	diff. of av. = 2.28
106-113	10	5	$\sigma_{diff} = .360$
98-105	6	2	true difference of av. 2is between 3.28 & 1.20
	N = 161	N = 161	
			$\frac{2.28}{.360} = 6.3 \sigma$
			E. A. is 3 months in favor of Urban

TABLE 15. FREQUENCY DISTRIBUTION OF COMPOSITE SCORES MADE
BY EACH GROUP ON THE STANFORD ACHIEVEMENT TEST

Composite Score	Urban	Rural	
970-999	1		
940-969	2	2	Urban Group
910-939	1	2	Mean = 713.32
880-909	7	3	$\sigma = 3.538$
850-879	7	6	$\sigma_{av} = .279$
820-849	10	1	
790-819	10	14	Rural Group
760-789	14	15	Mean = 692.27
730-759	16	18	$\sigma = 3.275$
700-729	19	16	$\sigma_{av} = .258$
670-699	14	20	
640-669	22	17	diff. of av. = 21.05
610-639	11	15	$\sigma_{diff} = .380$
580-609	9	14	true difference of av. is between 22.19 & 19.9
550-579	5	10	
520-549	7	3	$\frac{21.05}{.380} = 55.4 \sigma$
490-519	4	3	E. A. is 4 months in favor of Urban Group
460-489	2	3	
430-459	6	0	
400-429		1	
	N = 161	N = 161	

MEANING OF GRAPHS 1, 2, 3

Graph 1 shows the mean score made by each group in each test. From this graph it can be seen by how much one group surpasses the other for each test and by how much both groups fail to reach the norm set for pupils at the beginning of the ninth grade. Neither group reaches the norm set for any of the nine tests. The urban group surpasses the rural group in all tests excepting Arithmetic. The urban group falls lowest in Arithmetic Computation, while the rural group made its lowest score in Language Usage.

Graph 2, Page 42, shows the number of months in Educational Age that the urban group falls below the norm set by the Stanford Achievement Test for pupils entering the ninth grade. Column 5, which represents test 4 in Graph 1 shows that it misses the norm farthest -- 19 months -- in Arithmetic Computation and column 8, which represents test 6 in Graph 1, shows that it comes closest to the norm -- four months -- in Nature Study and Science.

Graph 3, shows the number of months in Educational Age that the rural group falls below the norm set by the Stanford Achievement Test for pupils entering the ninth grade. Column 10, which represents the rural group's score in Test 8, Graph 1, shows that it misses the norm farthest in this test. Column 6, which represents

the rural group's score in Test 5, Arithmetic Reasoning, shows it came closest to the norm in this test. A comparison of Graphs 2 and 3, shows that the rural group is farther from the norm in all tests, excepting Arithmetic Computation, Arithmetic Reasoning, and Arithmetic Total, than the urban group.

Graph 7

This is a percentile graph of each of the two groups in the National Intelligence Tests. It is shown by this graph that the median intelligence for the entire group of urban pupils is higher than the median for the entire group of rural pupils.

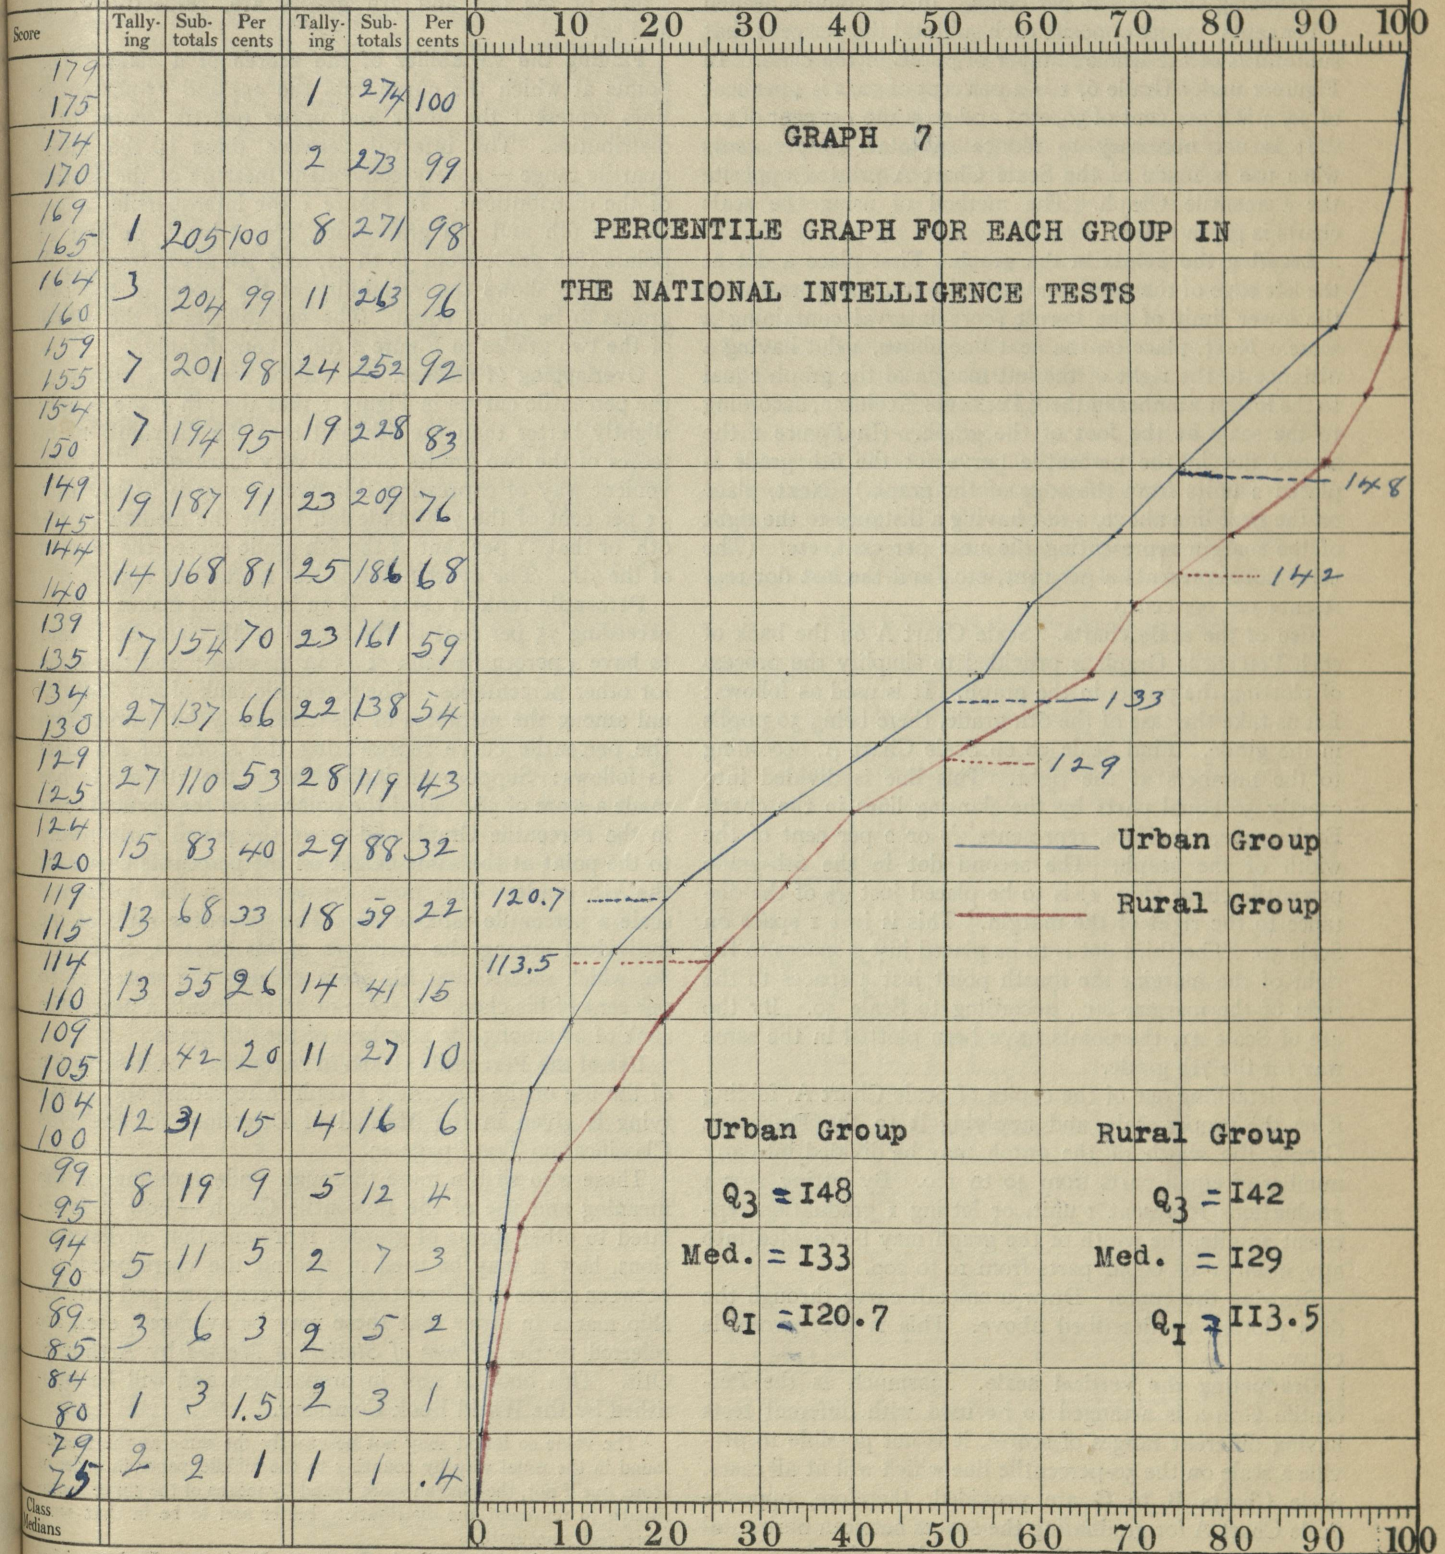

The median score in intelligence for the urban group, as shown in Graph 7, is 133. The median score in intelligence for the rural group, as shown by Graph 7 is 129. A score¹ of 133 in the National Intelligence Tests equals a Mental Age of 15 years and six months. A score of 129 equals a Mental Age of fourteen years and four months. The difference between the Mental Ages of the two groups shows that the urban group is one year and four months ahead of the rural group. The average chronological age for the urban group is 14 years, and 10 months while the average chronological age for the rural group is 15 years and 4 months. The Mental Age of the urban group is 8 months above its average Chronological Age. The Mental Age of the rural group is one year below its average Chronological Age.

Percentile Graph

Finding the subtotals. Begin at the bottom of the column of frequencies and place in the square to the right of each frequency the sum of the frequencies up to and including that frequency. In the subtotal column under 6th grade (Fig. 1) there is 1 score in the first interval, a subtotal of 2 to and including the second interval, a subtotal of 4 to and including the third interval, etc., and 50 to and including the last interval. This last "subtotal" (50) should equal the number of pupils in the class, as entered at the top of the column.

Reducing subtotals to per cents. In the column headed "Per cents" write opposite each subtotal the per cent that subtotal is of the whole number of pupils in the class. In Figure 1 under Grade 6, 1 is 2 per cent of 50, 2 is 4 per cent of 50, 4 is 8 per cent of 50, etc., and 50 is 100 per cent of 50.

It is not necessary to reduce subtotals to per cents when use is made of the Scale Chart A printed opposite the Percentile Graph. The method of using the scale charts is given below.

Locating the points in the graph. First place a dot at the left edge of the graph on the horizontal line representing the lower limit of the lowest score interval containing a score. Next, place on the next line above, a dot having a distance to the right of the left margin of the graph equal to the lowest number in the "Per cents" column, according to the scale at the foot of the graph. (In Figure 1 the second dot in the percentile curve for the 6th grade is placed 2 units from the edge of the graph.) Next, place on the next line above, a dot having a distance to the right of the margin representing the next per cent, etc. (The third dot represents 4 per cent, etc., and the last dot represents 100 per cent.)

Use of the scale charts. Scale Chart A on the back of each Percentile Graph is provided to simplify the process of plotting the points in the graph. It is used as follows: Let us take the case of the 6th grade, there being 50 pupils in the grade. Find Scale 50 on Scale Chart A, according to the numbers at the right. This line is divided into exactly 50 equal parts by the slanting lines in the chart. Each space, therefore, represents $\frac{1}{50}$ or 2 per cent of the width of the graph. The second dot in the 6th-grade percentile curve (Fig. 1) is to be placed just $\frac{2}{50}$ of the distance to the right of the margin. This is just 1 space on Scale 50. The third dot is to be placed just 2 spaces to the right of the margin, the fourth point just 4 spaces to the right of the margin, etc., according to Scale 50. By the use of Scale 41, the points have been plotted in the same way for the 7th grade.

By detaching one of the copies of Scale Chart A, folding it on the proper scale, and applying it to the Percentile Graph, the width of the graph may be divided into any number of equal parts from 40 to 100. By letting 2 or 4 graduations represent 1 unit, or letting 1 graduation represent 2 units, the width of the graph may be divided into any number of equal parts from 10 to 200.

Drawing the curve. Draw a smooth curve through the dots plotted as described above. This is the percentile curve.

Graduating the vertical scale. Inasmuch as the Percentile Graph is arranged to be used with different tests having different ranges of scores, it is not possible to provide a scale on the 50-percentile line which will fit all cases. Scale Charts B to G are provided, therefore, opposite Scale Chart A for graduating the spaces between horizontal lines to scales corresponding to groupings of 1, 2, 3, 4, 5, and 10 units to the interval. By applying the appropriate

one of these scales to the Percentile Graph, the score represented by the point at which a percentile curve cuts the 50-percentile line, or any other percentile line, can be read to the nearest unit. To graduate the vertical scale of the Percentile Graph to correspond to a grouping in intervals of 5 units, as in Figure 1, use Scale Chart F; when intervals of 3 units are used, as in Figure 2, use Scale Chart D; etc.

Finding the median score of a class. The point where the percentile curve cuts the 50-percentile line represents the median score of the group.¹ In Figure 1 the median scores of the 6th and 7th grades are, respectively, 45 and 50.

Finding the variability of the scores of a class. The points at which the curve cuts the 25- and 75-percentile lines represent the lower and upper quartile scores of a distribution. The interval between these is the interquartile range — a very convenient measure of the scatter of the distributions. In Figure 1 the interquartile ranges for the 6th and 7th grades are, respectively, 14 and 13 points (6th grade from 38 to 52, and 7th grade from 43 to 56). This shows the variability of the scores of the two grades to be about equal. The variabilities of the scores of the two grades in Figure 2 differ considerably.

Overlapping of classes. It will be seen by a glance at the percentile curves in Figure 1 that the 7th grade is only slightly better than the 6th and that the distributions of scores of the two grades overlap very markedly. A convenient way of expressing this overlapping is to say that 31 per cent of the 7th grade fall below the median of the 6th, or that 31 per cent of the 6th grade exceed the median of the 7th. The overlapping is less marked in Figure 2.

Percentile rank in class. If an individual makes a score exceeding 75 per cent of the scores of his class, he is said to have a percentile rank of 75 in his class; and the same for other percentages. The percentile rank of any individual among the members of his class may be found from the percentile curve representing the scores of his class as follows: Suppose an individual in the 7th grade has made a score of 58. Find the point 58 on the vertical scale in the Percentile Graph and move the pencil horizontally to the point at the same height on the percentile curve for the 7th grade. This point represents on the horizontal scale a percentile rank of 80. The percentile rank of the individual among the members of his class is, therefore, 80, which means that his score exceeds the scores of 80 per cent of his class. A score of 58 represents a percentile rank of 90 among the members of the 6th grade.

Use of the Percentile Graph in regrading. A description of the use of the Percentile Graph in regrading and classifying is given in the Manual of Directions for the Otis Classification Test,² page 49.

Those who wish a more thorough understanding of the meaning and use of the Percentile Graph — how it is related to other forms of graphic representation of distributions, how it may be used in finding the correspondence between scores in different tests, between scores and scholarship marks in order that these may be averaged, etc., are referred to the *Primer of Statistical Method* by Arthur S. Otis. This book is now in preparation and will be published by the World Book Company.

¹ The value so found may not be exactly the same as the median found in the usual way by counting to the middle paper in order of score, but if not, the median score found by means of the curve is considered to represent the distribution better and to be in that sense more nearly accurate.

² Published by World Book Company, Yonkers-on-Hudson, New York.

UNIVERSAL PERCENTILE GRAPH

By ARTHUR S. OTIS

DIRECTIONS

Purpose. In order to compare the score of a pupil in a test with the scores of the class as a whole or to compare two or more classes, the most effective way is to draw a percentile curve for each grade or class on a Percentile Graph. The Universal Percentile Graph is designed for use with any test. The method of drawing a percentile curve is given in full below. One not familiar with percentile curves will appreciate their significance after studying the directions for drawing them.

A percentile curve shows at a glance not only the median score of a class but also the range and variability of the scores. It shows at a glance just what per cent of the scores of the class is exceeded by the score of any given individual and just what per cent of the class attains or exceeds any given score. Two or more curves on the same graph show very vividly the amount of overlapping of the scores of different classes.

General procedure. The steps taken in drawing the percentile curve are: (1) distributing the scores, (2) finding the subtotals — number of cases to and including those in each interval of score, (3) reducing these subtotals to per cents of the number of cases in the group, (4) locating points in the graph representing these per cents, and (5) drawing a smooth curve through these points.

Provision is made for distributing the scores of two groups

of individuals on one Percentile Graph sheet, and from these distributions two percentile curves may be drawn. The scores of additional groups may be distributed on other Percentile Graph sheets, or any sheet of paper, and as many curves drawn on one graph as may be conveniently distinguished.

The blank spaces at the top of the sheet should be filled as shown in the sample Percentile Graphs (Figs. 1 and 2).

Distributing the scores. First, choose a suitable interval of score (number of units to be grouped into one interval) so that the distribution will not be too long for the graph or so short as to be unduly cramped. Next, enter in the column at the left headed "Score" the intervals of score chosen, such as 0-4, 5-9, 10-14, etc., as shown in Figure 1, or 0-2, 3-5, 6-8, etc., as shown in Figure 2. Next, in one of the columns headed "Tallying," distribute the scores of a grade by putting a short mark for the score of each individual opposite the interval of score within which the score falls. For example, Figure 1 shows that in the 6th grade two pupils made scores between 65 and 69 in the Otis Achievement Test,¹ two pupils made scores between 60 and 64, five made scores between 55 and 59, etc. The number of tallies, which tells the number of scores falling within any interval of score, is called a "frequency." The frequency of scores of 6th-grade pupils between 50 and 54 is 8.

¹ This is Part I of the Otis Classification Test.

TABLE 16

This table shows the results of the data obtained from the reports of the school nurses. Not all of the high schools in Sumner county had their pupils inspected, but we were able to get the data for 310 pupils who were examined. This number included 208 from the urban group and 102 from the rural group.

The numbers in the first two columns show the number of pupils reported under each head for each of the two groups. Columns 3 and 4, show these results in terms of per cent for each group. Columns 5 and 6, show the difference in per cent for each item in columns 3 and 4, the difference in per cent being placed in the column having the higher per cent in columns 3 and 4. A closer inspection of columns 5 and 6, will reveal the fact that the per cent of each group which is normal in weight, vision, hearing, and teeth is practically the same. But the difference in per cent of pupils normal in tonsils, adenoidal growth, and thyroid and lymph glands is quite marked. It is also interesting to note from columns 3 and 4, that more than half -- 58.3 per cent of the urban and 52.9 per cent of the rural -- of each group are below normal in weight. While 19.5 per cent of the urban group and 15.6 per cent of the rural group are reported as having defective vision, only 8.1 per cent of the urban group and 7.8 per cent of the rural group are reported as wearing glasses. 41.3 per cent of the urban group and 42.7 per cent of the

rural group have defective teeth. Practically the same per cent of each group has infected tonsils, urban 29.8 per cent and rural 28.4 per cent. About one-fifth of the pupils of each group has had its tonsils removed, about one-eighth has had its adenoids removed.

There is a much larger per cent of enlarged thyroid and lymph glands among the pupils of the urban group than among the pupils of the rural group, 19.2 per cent to 6.8 per cent.

CHAPTER V

SUMMARY AND CONCLUSIONS

From the data presented in Chapter IV, the following answers to the questions raised in Chapter III can be made:

A. The two groups are alike,

a. Both the urban and the rural groups are below the norm set by the Stanford Achievement Test for pupils entering the ninth grade.

b. As shown by the physical data, the two groups are closely alike in weight, vision, hearing, and teeth.

B. The two groups differ,

a. The Mental Age for the urban group is one year and two months higher than it is for the rural group.

b. The urban group is ahead of the rural group in all of the sets of scores in achievement, excepting those in Arithmetic. In the sets of scores in which the urban group surpasses, the range is from 11 months in the Reading Total scores Graph 4, to 3 months in both Nature Study and Science, and Dictation. In the Arithmetic scores the rural group surpasses the urban group from 6 months in Arithmetic Computation to one month in Arithmetic Reasoning. In each group of scores compared in the Stanford Achievement Test, the Reliability of the Difference was more than 3 sigmas.

c. 13.7 per cent more of the pupils of the urban group has normal tonsils and 12.2 per cent more of the pupils of this group is without adenoids than among the pupils of the rural group. 12.4

per cent more of the pupils of the rural group is without enlarged thyroid and lymph glands than of the pupils of the urban group.

TOTAL		Sum	

If you completed the eighth grade in a town school, answer these questions; Name of school....., Name of town.....

If you completed the eighth grade in a country school, answer these questions; Name of school....., Number of school district....., County in which school is located.....

Exercise 1

Do this work in arithmetic as quickly as you can without making mistakes. Try each example as you come to it. Look carefully at each one to see what you are to do.

Begin here

(1)
Add

$$\begin{array}{r} 4 \\ 2 \\ \hline \end{array}$$

(2)
Multiply

$$4 \times 5 =$$

(3)
Add

$$\begin{array}{r} 32 \\ 25 \\ \hline 19 \end{array}$$

(4)
Subtract

$$\begin{array}{r} 13 \\ 5 \\ \hline \end{array}$$

(5)
Divide

$$11 \div 3 =$$

(6)
Multiply

$$\begin{array}{r} 5073 \\ 9 \\ \hline \end{array}$$

(7)
Divide

$$37 \overline{)14282}$$

(8)
Subtract

$$\frac{6}{7} - \frac{4}{5} =$$

(9)
Divide

$$\frac{3}{4} \div 5 =$$

(10)
Multiply

$$\begin{array}{r} 358\frac{1}{3} \\ 26 \\ \hline \end{array}$$

Exercise 2

SAMPLES { Sheep eat mostly nuts grass fruits bread
 The number of cents in a dime is 2 5 10 25

In each sentence draw a line under the one word that makes the sentence true.

Begin here

- 1 The number of days in a week is 5 6 7 12 1
- 2 The kitten is the young of the dog cat lion sheep 2
- 3 The day before Thursday is Wednesday Tuesday Friday Monday . 3
- 4 Cheese comes from butter plants eggs milk 4
- 5 Leather comes from cotton wool skins bark 5
- 6 An animal that moves very slowly is the snail squirrel rabbit deer . 6
- 7 The elm is a kind of bush flower vine tree 7
- 8 Soap is made from sugars fats pears lemons 8
- 9 Easter comes in fall winter spring summer 9
- 10 Figs grow on a bush stalk tree vine 10
- 11 America was discovered by Drake Hudson Columbus Raleigh 11
- 12 Glass is made of sand gravel clay mica 12
- 13 The highest price per pound is usually paid for flour sugar coffee salt 13
- 14 Pearls are obtained from mines elephants reefs oysters 14
- 15 The tadpole is the young of the fish frog lizard crayfish 15
- 16 Cypress is a kind of machine food fabric tree 16

Test 2

In each sentence draw a line under the one word that makes the sentence true, as shown in the samples.

SAMPLES { Sheep eat mostly nuts grass fruits bread
 The number of cents in a dime is 2 5 10 25

Begin here

- | | | | | | | | |
|----|--|--------------|-------------|---------------|--------------|-------|----|

TEST 1. READING: PARAGRAPH MEANING

Sample: Dick and Tom were playing ball in the field. Dick was throwing the ball and
was trying to catch it.

Write **JUST ONE WORD** on each dotted line.

-
- 1 Fanny has a little red hen. Every day the hen goes to her nest and lays an egg for Fanny to eat. Then she makes a funny noise to tell Fanny to come and get the.....
 - 2 A kitten can climb a tree, but a dog cannot. This is very lucky for Nellie's kitten. Every time Joe's big dog comes along the kitten climbs a tree and the..... cannot follow.
 - 3 Anna had never seen a squirrel in her life, although she had always wanted to very much. One day when she was playing under a tree she heard a funny little noise over her head. She looked up, and what do you think she saw? Up there in the..... was the very thing she had always wanted to see, a
 - 4 John and Joe played one day till they were very hungry; so John went into the house and asked his mother for something to When he came out again he had a big apple for himself and another for
 - 5 One day when Jane was sweeping she found a dime on the floor under the bed. They could not find out whose dime it was, so Jane's mother gave it to her. Now, every time Jane the floor she looks carefully under the bed for another.....
 - 6 Helen and Kate pulled their sled through the deep snow to the top of the hill and soon were coasting swiftly down again. They did this over and over. The was so deep that they found it hard work to drag the to the top.
 - 7 Once a black raven wanted to have white feathers like a swan. The raven saw that the swan lived in the water, and thought it was the water that made the swan's feathers so white. So the decided to wash his feathers every day to see if it would not make them
 - 8 Birds' eggs are almost as different from each other as are the birds themselves. The robin lays four or five blue eggs. The dove lays two white eggs. The sparrow lays six or eight speckled eggs. If we should find a nest with four blue eggs in it, we could be pretty sure that it was the nest of a rather than of a or dove.
 - 9 Once there lived on a mountain near a village an immense giant whose cruelty kept the people of the village in great terror. However, there was one person in the village who was not afraid of the giant. This was a young soldier who carried a magic sword that a fairy had given him. Once when the came down from the the soldier attacked him with his magic and killed him.
 - 10 Once a hen was so foolish as to go to a fox and ask him to look after her chicks while she went to the barnyard to find some worms for her chicks. The fox was of course quite willing. The hen was gone a long time. When she finally returned, she found that the fox had eaten all her chicks. Since then no has employed a as a nurse.

TEST 1, CONTINUED

- 11 When the bear appeared near the hut, Walter was alone. His father had driven to the village, that morning, several miles away. Fortunately he had left his gun hanging on the wall loaded and ready for service. Walter was excited, but he did not hesitate. Quickly seizing the he the
- 12 In a certain village a ton of coal costs just as much as a cord of wood, but it produces twice as much heat. Therefore the poor families in this village should be advised to burn rather than
- 13 "Come on," called Joe, "let's go for a swim down by Jones' Point, where the river is deep." "No," said Pete, "let's swim down by Duggan's, where the water is warmer." "It isn't because the water is warm that you want to go to, but because you can't swim," said
- 14 Richard and Miss Cabot quickly found their way alone to the house of Mr. Smith on Craven Street. Miss Cabot left Richard in the carriage, walked quickly to the door, and sending up her card by the servant, requested to see Mr. Smith. The soon returned and begged her to come in. As soon as she had done so, Miss Cabot introduced herself to Mr. and begged him to come out and talk with, who was waiting outside in the carriage.
- 15 Joe made up a game which he called "Jac-alack." One person called Jack must climb a tree and hang by his arms from a low bough. The others stand behind him and say in unison, "Alas, alack, he fell on his back," and while they are saying it, one of them hits Jack with a bean bag. If Jack can see or guess who did it, he may drop down, and the guilty person takes his place. Otherwise he has to there for another turn and sing out, "Alas, alack, another whack." It is quite a game and Jack must have strong
- 16 It is well established that the bee, which is commonly supposed to be so industrious, really works only two or three hours a day. The man who works eight or ten hours a day is therefore far more than the
- 17 Boys and girls know my name. And mothers and fathers, too. Big folks love me. You do, too. The first letters in the first four sentences of this paragraph spell my name; so write it here
- 18 Energy is a measure of the fullness of life and is indispensable for genius. No energy at all is death. Idiots are feeble and listless. Nearly all the leaders of mankind have been noted for their remarkable
- 19 Deciduous trees lose their leaves in winter, while evergreens, as their name implies, do not. Therefore, in forests composed of trees the ground is less shaded in winter than is the case in forests whose trees are
- 20 Some historians believe that the spread of anti-slavery feeling among the people of the North previous to the Civil War was due less to the moral issue involved than to the fact that they recognized the system of as a menace to the industrial system of free labor.

TEST 1, CONTINUED

- 21 If I were writing about the rich, I should be inclined to divide them, according to their attitude toward life, into workers and parasites. The motto of the worker is, "I owe the world a life," and the motto of the is, "The owes me a living."
- 22 Caution, when not present in excess, is a desirable trait. Often it saves one from disappointment or failure. Occasionally, however, one finds a person so extremely that his will is paralyzed and he is totally unable to set about any new undertaking. Too much is indeed often than too little.
- 23 A whale is not a fish, even though it does live in water. A fish has no lungs, is cold-blooded, and absorbs oxygen from the water through its gills; but a whale is warm-blooded and has a genuine set of lungs. In consequence, in bodily structure the is like a shark, which is a true fish, than it is like a horse.
- 24 The brook on our farm has many whims. It ripples over bright and shiny rocks, and falls into a placid little pool so clear that I can see the pebbles on the bottom and can see myself down there, too. As I look straight down, it is hard to tell whether what I see is my nose or a, but as I move a little, that which I see stands still, so I know it is not Farther on the brook forgets the placid pool and tumbles over roots and rocks. It does, indeed, have many
- 25 To pant for recognition, to yearn to impress one's personality upon one's fellow-men, is the essence of ambition. The ambitious person may think that he merely thirsts to "do something" or "be somebody," but really what he craves is to figure potently in the minds of others, to be greatly loved, admired, or feared. To reap a success which no one does not satisfy the yearnings of the individual.
- 26 Washington was a very silent man. Of no man in the world's history do we have so few sayings of a personal kind. As for talking about himself, that was something in which he almost never indulged. Yet it would be a great error to interpret his as an indication that he was in any sense cold or unfeeling.
- 27 As a rule, it is more economical to remember things by associating them clearly and vigorously than by going through many repetitions of them. Thus, a clear understanding of the causes for the Democratic victory in the national election in 1916 will be effective in remembering the fact than a dozen of the statement "Woodrow Wilson was elected in 1916."
- 28 Fundamentally, education depends upon the capacity of a person to profit by past experiences. Past situations modify present and future adjustments. Education in its broadest sense means acquiring experiences that serve to existing inherited or acquired tendencies of behavior.
- 29 "Naïve" and "unsophisticated" are frequently confused. The former suggests a type of behavior which is artless, spontaneous, and free from the restraints of custom. The latter implies fully as great lack of knowledge of social usage, and, in addition, conduct which is primitive and perchance inelegant. Thus, the youth was the first to enter the car, and his little sister warmly kissed him in the presence of the king. We may also say that a country boy is with respect to city life and customs.

TEST 5. ARITHMETIC: REASONING

Find all the answers as quickly as you can.

Write the answers on the dotted lines.

Use the blank sheets of paper to figure on.

Begin here.

- 1 How many are 3 eggs and 2 eggs? Answer
- 2 Mary is 7 years old. How old will she be in 3 years? Answer
- 3 A hen had 9 chicks and 3 of them died. How many were left? Answer
- 4 Milk costs 8 cents a pint and the milkman is going to raise the price 2 cents. What will it then cost? Answer
- 5 If you buy a pencil for 4 cents and pay for it with a dime, how much change should you get? Answer
- 6 How many dimes are there in a dollar? Answer
- 7 How many eggs are there in 7 nests if each nest has 3 eggs? Answer
- 8 How many cents will 8 oranges cost at 3 cents each? Answer
- 9 David earned \$3.50 in June, \$2.25 in July, and \$1.50 in August. How much did he earn in all? Answer
- 10 Frank bought 3 two-cent postage stamps and 13 one-cent stamps. How much did he pay for all? Answer
- 11 Five girls buy a present costing 25 cents. How many cents does each pay? Answer
- 12 If a train goes 60 miles in three hours, how far does it go in one hour? Answer
- 13 John has saved \$3.75. How many dollars more does he need to buy a pony which costs \$45.75? Answer
- 14 A man pays the street-car fare for himself and two friends. If the fare is 7¢, how much change should he receive from a half dollar? Answer
- 15 A train which was due at 2 P.M. was $3\frac{1}{2}$ hours late. When did it arrive? Answer
- 16 What is the cost of 10 oranges at 2 for 5 cents? Answer
- 17 Edward has \$1.67 in the bank and takes out 2 quarters, a dime, and a cent. How much does he have left in the bank? Answer
- 18 What is the cost of a $4\frac{3}{4}$ -pound roast at 40 cents a pound? Answer
- 19 A boy saved 5 cents a day for two weeks, and 10 cents a day for the next four weeks. How much money does he then have? Answer
- 20 A gallon is equal to 231 cubic inches. How many gallons are there in a tank $6 \times 7 \times 11$ inches? Answer
- 21 The tax rate in an Eastern city has varied as follows: 1910, 21¢ on each \$100; 1911, 17¢ on each \$100; 1912, 27¢ on each \$100; 1913, 26¢ on each \$100; 1914, 34¢ on each \$100; 1915, 33¢ on each \$100. The highest rate was how many times as great as the lowest? Answer
